

WECHSLER INTELLIGENCE SCALE
FOR CHILDREN® – FOURTH EDITION

TECHNICAL REPORT #7

WISC-IV Extended Norms

Jianjun Zhu, PhD, Tom Cayton, PhD, Larry Weiss, PhD, & Amy Gabel, PhD

PEARSON
A yellow swoosh graphic positioned below the Pearson logo.

The WISC-IV extended norms were developed in response to a request from the National Association for Gifted Children (NAGC).

These norms are used to further differentiate highly gifted children (FSIQ or GAI above 150) from gifted children (FSIQ or GAI 130–150). The extended norms are useful when a child's score is the maximum (ceiling) on two or more subtests (e.g., obtains scaled scores of 18 or 19 points). These norms extend the **WISC-IV** upper scaled score range to 28 points for subtests and 210 points for composites. It is important to note that the extended norms are not useful for most children. Among the 2,200 cases in the **WISC-IV** standardization sample, only one child obtained a GAI score of 151 and none obtained an FSIQ score of 150 or higher. According to the bell curve, out of 20,000,000 same-age peers, only one child would be expected to obtain a FSIQ of 180 or higher.

The **WISC-IV** extended norms were developed using the natural ceiling of the test, **WISC-IV** standardization data, and the validity data (highly gifted sample) provided by the NAGC. These norms are based on the same measurement metrics used in all Wechsler scales, same-age peers, and are consistent with the normal bell curve. These features ensure the meaningful comparison of IQ and index scores derived from all current Wechsler scales or other tests that use the same measurement metrics. NAGC provided the validity data as a benchmark to guide development of the extended norms. Dr. Linda Silverman of NAGC also provided two cases categorized as extremely gifted to beta test the extended norms. NAGC experts confirmed that scores from these cases were "within the expectation."

The rate of concept acquisition is highest during early ages. As a result, median raw score changes across the younger ages will be greater than median raw score changes with adolescents. Smaller changes in median raw scores at higher ability levels will represent larger and larger differences in calculated mental ages. Therefore, age-equivalents based on these median raw scores cannot be considered equal interval or ratio scales and therefore, should not be added, subtracted, divided or multiplied (see Bracken, 1988; Harrison & Oakland, 2002).

The **WISC-IV** extended norms described in this report are more psychometrically sound and easier to compute than ratio computations based on age equivalents data (e.g., mental age ÷ biological age × 100). For the purpose of interpretation, all the tables provided in the **WISC-IV** manual, such as reliability, SEM, critical values, and base rate tables, can be used to interpret the scores derived from the extended norms. The scores derived from the extended norms should be interpreted the same way as any other standard scores derived from the **WISC-IV**. The following wording is recommended when the extended norms are used:

Because {child's name} obtained the top scaled score on {number of subtests} **WISC-IV** subtests, his/her composite scores were based on a special table of extended norms created, in part, from a sample of highly gifted children (see the **WISC-IV** Technical Report #7). Using these extended norms, his/her scores are as follows: . . .

Because the natural ceilings of the **WISC-IV** subtests are not equally high, the maximum scaled scores are not the same across all subtests. The maximum scores across all ages may not be equally high because of these ceiling differences. The possible extended scaled, IQ, and index scores are higher for a younger child, so his or her scores could be lower when assessed a few years later (depending on the length of the testing interval).

The extended **WISC-IV** norms are very informative in differentiating highly gifted children from gifted children; however, this new endeavor requires further clinical validation.

Validity Study Using National Association for Gifted Children Sample

The NAGC sample contains 157 usable cases with a mean age of 8.71 years, the SD = 1.85 years,

ranging from 5.64 to 13.8 years. The sample consists of 61% males and 39% females. Table 1 reports the mean subtest, index, and IQ scores of the sample. Table 1 shows that scores based on the extended norms average about 1 to 2 points higher than the scores based on the regular norms. The maximum score and variance for each composite score significantly increased. As expected, the composite scores with high g-loading, e.g., VCI, PRI, and GAI, show the most increases in the maximum score. About 37.2% of the sample showed 1 to 17 points improvement when the extended GAI norms were used. In contrast, only 2.3% of the **WISC-IV** standardization sample showed 1 to 3 points improvement when the extended GAI norms were used. These results indicate that the **WISC-IV** extended norms indeed improved the differentiation among the gifted children.

Table 1. Mean WISC-IV Scores for the NAGC Sample

Variable	N	Mean	SD	Min	Max
Block Design	154	14.1	2.4	7	19
Matrix Reasoning	153	15.7	3.4	7	26
Picture Concept	155	15.3	2.4	7	21

FSIQ Extended	157	135.1	8.8	120	159
GAI	156	139.2	10.6	120	160
GAI-Extended	157	140.5	11.5	120	176

Note: All subtest scaled scores are based on the extended norms.

Case Study

Name: K.O.

D.O.B. 10/30/99

Sex: Male

Test Date: 3/26/07

Age: 7 years 4 months

Because K.O. obtained the top scaled score on eleven **WISC-IV** subtests, his subtest scaled score, and composite scores were derived from special **WISC-IV** extended norms created, in part, based on a sample of highly gifted children. Using the extended norms reported in **WISC-IV** Technical Report #7 (The Psychological Corporation, January 2008) his scores are as follows:

Subtest	Scale Score			
	Raw Score	Regular	Extended	Percentile
Similarities	42	19	25	99.9
Vocabulary	62	19	28	99.9
Comprehension	39	19	28	99.9
(Information)	27	19	25	99.9
Block Design	51	18	18	99.6
Picture Concept	25	19	21	99.9
Matrix Reasoning	29	19	22	99.9
Picture Completion	34	19	22	99.9
Digit Span	28	19	25	99.9
Letter-Number Sequencing	24	19	21	99.9
(Arithmetic)	28	19	20	99.9
Coding	63	17	17	99.0

Composite	Sum of Scaled Score		Composite Score		Percentile
	Regular	Extended	Regular	Extended	
Verbal Comprehension	57	81	155	204	>99.9
Perceptual Reasoning	57	65	155	171	>99.9
Working Memory	38	46	150	177	>99.9
Processing Speed	31	31	131	131	98.0
Full Scale IQ	183	223	158	192	>99.9
GAI	114	146	160	208	>99.9
